N° **ME04/1218/01A**

Data: **06/03/02**
Date:

1. GENERAL DATA

- Sample arrival date: 26/10/01 (D.d.T. n° 971 of 24/10/2001)

- Date of the test: 14/12/01

- Identification of test methods:

European Directive 96/37/EEC

Anchorage testing

DECLARATION

- Test results of this test report refer only to the sample tested
- This test report cannot be partially copied without the Managing Director's consent

2. TESTED SAMPLE

There were supplied N°2 bench seats "FASP 505".

3. TEST SAMPLES SET-UP

The samples have been fixed on a steel frame (as prescribed in 96/37ece at point 1.2 of annex 3). The frame with the mounted seats, then, have been fixed on the sled (the employment of the steel frame instead of the actual car chassis had been considered as a more conservative approach since the car chassis frequently absorbs some of the dynamic energy by deformation).

The seat back of the bench seats was locked in a position corresponding to a rearward inclination of 25° from the vertical of the torso reference line of the manikin indicated in the Appendix 1 of the referenced directive.

N° 1 bench seat was placed with the longitudinal adjustment fixed one notch rearward of the most forward normal driving position.

N° 2 bench seat was placed with the longitudinal adjustment fixed one notch forward of the most rearward normal driving position.

(as prescribed on 96/37ece at point 1.1; 1.3; 3.3; 3.4)

4. TEST EXECUTION

There was performed 2 dynamic tests on the sled with the samples set-up as described above. The first test was performed in the **FORWARD** direction and subsequently, another in the **REARWARD** direction.

The tests were performed in such way to apply a longitudinal horizontal deceleration of 20 g for a minimum time interval of 30 ms in accordance with the requirements of the European Directive 96/37/EEC.

5 RESULTS

TEST 1

1. Deceleration direction **FORWARD**
2. Velocity at the beginning of the deceleration: **13.7 m/s**
3. Time interval above 20 g deceleration: **37.8 ms**
4. Peak deceleration: **24.94 g a 53 ms**

TEST 2

1. Deceleration direction **REARWARD**
2. Velocity at the beginning of the deceleration: **13.6 m/s**
3. Time interval above 20 g deceleration: **37.7 ms**
4. Peak deceleration: **24.72 g a 49 ms**

6. REMARKS

No failure were observed in the seat frames or in the seat anchorage, the adjustment and displacement systems or their locking devices during and after the tests.

No failure were observed of the head rest during and after the tests.

No release of the locking systems have occurred during the tests.

After the two tests it's not possible to move the bench seats in the longitudinal direction.
